

ABSTRACT

To provide a liquid crystal device a liquid crystal display having a high contrast over wide viewing angles while reducing the color distortion.

5 A liquid crystal display device comprises a first substrate on which a plurality of pixel electrodes are formed, a second substrate on which an opposing electrode is formed, and a liquid crystal layer sandwiched between the first and second substrates, the second substrate further having thereon
10 a plurality of protrusions, each of the protrusions being positioned at a substantially central portion of a corresponding one of the pixel electrodes.
